A One observation: Laplace diverges at a fold
mode at f ≈ 7.9
mode at f ≈ 5.0
slope 1
Laplace − exact log evidence (quadrature)
−½ log H (curvature at the mode)
B The three failures: path to the fold
α₀=1.3, n=30, data set 1
α₀=1.7, n=30, data set 1
α₀=1.7, n=60, data set 2
gap = −½ log λ_min
Laplace − IS log ML
−½ log λ_min(I + K^½ W K^½)
C Folds need ρ ≥ 1; ρ falls with n
no fold
fold (Laplace failure)
ρ = 1
no-fold ratio ρ at the Laplace optimum
n = 30
n = 60
n = 120
n = 240
